The schematic shows a 74HC165 shift register (U801) used for board identification. The SI pin (pin 10) is connected to a +3V3 supply through a 5k1 resistor (R801) and a normally closed jumper JP801. The D0-D7 pins (pins 11-18) are connected to HWCFG_LOW or HWCFG_HIGH signals. The CLK pin (pin 2) is connected to HWCFG_CLOCKD. The INH pin (pin 15) is connected to HWCFG_SHIFTD. The SH/LD pin (pin 1) is connected to GND. The Q[7:0] pins (pins 9, 7, 16) provide the HWCFG_DATA output. A capacitor C801 (100nF) is connected between HWCFG_HIGH and HWCFG_LOW.

Board Identification

Grid firmware can identify the hardware and the board revision thorough a 3 wire serial interface using one or more shift register as read only memory. The content of the memory is defined by pulling the inputs high or low through pcb traces or solderable configuration jumpers.
